

Tall Bugbane

Actaea elata var. *elata*

A member of the family Ranunculaceae (“buttercups”), this species was formerly identified under the genus *Cimicifuga*. Members of the genus *Actaea* are also known by the common name “baneberry”, a group of plants whose waxy shiny red or white berries are highly toxic and cause damage to cardiac tissue when consumed by mammals, but are not toxic to birds which consume and disperse the seeds through their droppings.

Characteristics

Height up to 2 m. Plants feature large compound leaves and numerous (50 to 900), tiny white flowers clustered on branched bottlebrush-like flower spikes (racemes). The alternate leaves are divided into threes, with 9-17 lobed leaflets, each up to 18 cm long. The flowers of tall bugbane lack petals and instead attract pollinators with numerous showy white stamens. Each flower is surrounded by five tiny sepals. Unlike other members of the genus *Actaea*, fruits are green pod-like structures (up to 1 cm long) that remain on the plant long after flowering and split open in fall or winter to release about a dozen reddish-brown seeds.

Status

Global Status:	G4T4
Provincial Status:	S1
SARA Status:	Endangered
BC List Status:	Red (Candidates for- Extirpated, Endangered, or Threatened status)
